

Yash Adake

Software Engineer — Backend & DevOps

yashadakeofficial@gmail.com — +91-7715982570 — LinkedIn — yashadake.com

Professional Summary

Software Engineer with 2+ years of experience in designing, developing, and operating backend systems and cloud-native infrastructure. Strong expertise in Python (Flask/FastAPI), Golang, PostgreSQL, Docker, Kubernetes, and workflow orchestration using Apache NiFi and N8N. Experienced in handling production Kubernetes issues, CloudJiffy deployments, R&D initiatives, and Proof-of-Concept development.

Technical Skills

Programming Languages: Python, Golang, Java

Backend & APIs: Flask, FastAPI, REST APIs, Microservices Architecture

Databases: PostgreSQL, MySQL, SQL Optimization

DevOps & Cloud: Docker, Kubernetes, CloudJiffy, Containerized Deployments

Data & Automation: Apache NiFi, N8N, Workflow Automation

Testing & Tools: SoapUI (API & Load Testing), Git, GitHub, Linux **API Documentaion:** OpenAPI Specifications, Swagger

Professional Experience

Software Engineer – Backend & DevOps (R&D, POC)

ArthaVedh Consulting Pvt Ltd

2024 – Present

- Designed and developed backend services using Python (Flask/FastAPI) and Golang with focus on scalability and performance.
- Built and maintained Dockerized microservices deployed on Kubernetes clusters.
- Investigated and resolved production Kubernetes issues including pod scheduling failures, port conflicts, restart loops, and resource constraints.
- Worked extensively on CloudJiffy infrastructure involving multi-node deployments, service exposure, and load balancing behavior.
- Designed and implemented automated data ingestion and processing pipelines using Apache NiFi.
- Built workflow automation and backend orchestration using N8N.
- Conducted API validation and load testing using SoapUI.
- Actively involved in research, architecture design, and Proof-of-Concept development.

Projects

Stanli - Treasury Management System — Lead Backend Developer

- Architected microservices-based treasury platform with 10 services (Go/Python) processing bank statements and generating ML-powered cashflow forecasts.

- Implemented Apache NiFi ETL pipelines for automated CAMT.053/MT940 XML statement processing, populating 50+ PostgreSQL tables with transaction data.
- Implemented multi-tenant SaaS architecture with JWT authentication, role-based access control, and hierarchical permission system.
- Built multi-LLM integration framework (OpenAI, Claude, Gemini) for AI-powered treasury insights and financial analysis
- Designed OHLC charting system using TradingView Lightweight-charts for real-time treasury data visualization.
- Technologies: Go, Python, PostgreSQL, Apache NiFi, Docker, React, Envoy Proxy, Prophet, XGBoost

Enterprise Workflow Automation Platform (n8n)

- Architected and deployed 35+ event-driven workflows orchestrating multi-agent AI systems, KYC verification pipelines, and DevOps automation across distributed services.
- Built hierarchical AI agent system integrating OpenAI GPT-4 models with PostgreSQL memory management, enabling autonomous code generation, security auditing, and quality assurance workflows with structured JSON output parsing.
- Implemented end-to-end KYC/e-signature automation integrating third-party APIs (Digitap AI), conditional logic, email notifications (Mailjet), and webhook-based event processing with comprehensive error handling and retry mechanisms.
- Developed DevOps automation tools for Jira issue management and GitLab operations using MCP (Model Context Protocol) servers, enabling seamless integration between AI agents and external development tools.
- Designed RAG-powered chatbot leveraging Supabase vector stores, OpenAI embeddings, and Microsoft OneDrive integration for intelligent document retrieval and conversational AI capabilities.

Cloud-Native Data Pipelines (NiFi + PostgreSQL)

- Built automated pipelines to monitor incoming files, detect formats, transform data, and persist into PostgreSQL.
- Integrated pipelines with backend services for real-time data availability.
- Implemented logging, error handling, and fault tolerance for production readiness.

DigiRation – Slot-Based Ration Distribution System

- Designed a web and Android-based system to reduce overcrowding at ration shops using slot booking.
- Implemented backend services using Java and Spring Boot.
- Enabled transparent transaction tracking, reporting, and auditability.
- Tech Stack: Spring Boot, HTML, CSS, JavaScript, Bootstrap, Flutter.

Education

B.Tech – Computer Science and Engineering

DKTE Society's Textile & Engineering Institute, Ichalkaranji

2024

CGPA: 8.12 / 10

Certifications

- DataCamp – Python
- IIT Bombay Spoken Tutorial – Java
- IIT Bombay Spoken Tutorial – MySQL

Achievements

- Best Project of the Year at DKTE's Textile and Engineering Institute.
- Best Project Award – AICTE & IBM SkillsBuild Internship.

Leadership & Activities

- Technical Director – ACSES, DKTE.
- Outreach and Corporate Director – CodeChef DKTE.
- Event Lead and Programming MCQ Setter – National Level Tech Symposium.
